Project Proposal: Automated AI News Pipeline

Date: November 11, 2025

Overview

The manual process of gathering, filtering, and translating global news is a significant operational burden for many Thai businesses, limiting their strategic agility and competitiveness. This inefficiency creates a critical gap between the need for timely information and the ability to act on it.

The "Automated AI News Pipeline" is a standalone desktop application that directly solves this challenge. It automates the entire intelligence-gathering workflow by using a powerful, locally-run AI to find, score, and translate the most significant global news. The tool transforms raw information into structured, actionable intelligence, providing a decisive competitive advantage at zero operational cost.

Goals

1. **Automate the Curation Workflow :** Eliminate the manual labor of searching, filtering, and translating news.
2. **Deliver Prioritized Intelligence:** Use a local Small Language Model to score news for significance and provide high-quality, ready-to-use Thai translations.
3. **Ensure Zero Cost & Full Accessibility:** Deliver a standalone application that requires no APIs or subscriptions, making it free for all users.
4. **Create a Shared, Open-Source Platform:** Provide a valuable tool for the entire AIEAT community to use and build upon.
5. **Keep the privacy :** Users can use the application without connecting the other LLM via API, so the user doesn't need to worry about data leak or being used for A.I. training

Specifications

- User-Managed Sources: A UI to allow users to add, edit, and manage their own lists of news websites and keywords.

- 3-Stage Automated Pipeline:
    - Collection: Scrapes user-defined sources and saves new, unique articles to a local database.
    - Scoring: Assigns a significance score to each new article.
    - Prioritized Translation: The AI translates only the highest-scoring articles into Thai.
- Local Database: An SQLite database to store all articles, scores, and translations in a structured format.
- Local AI Engine: Powered by Small Language model, running locally
- KPIs: The system will be tested for 95% data extraction accuracy and effective ad removal.

Milestones

- Milestone 1: System Design & Research (Weeks 1-3)
    - This initial phase focuses on creating the complete architectural blueprint for the project.
- Milestone 2: Core Development & AI Integration (Weeks 4-10)
    - This phase involves the implementation of all core application components. Key activities include the development of the Web Scraping/Data Crawling, the Data Processing pipeline, and the LLM Integration & Prompt Engineering. This phase concludes with Packaging the Application for standalone release and preparing the initial GitHub repository
- Milestone 3: Testing & Quality Assurance (Weeks 10-11)
    - Running concurrently with the final stages of development, this phase is dedicated to ensuring the application is robust and reliable. includes comprehensive Unit Testing of individual components and User Acceptance Testing (UAT).
- Milestone 4: Documentation & Final Handoff (Weeks 12-15)
    - The final phase is focused on preparing the project for its public, open-source release and handoff. This includes creating the final GitHub installation guidelines, writing the comprehensive Study Report detailing the project's journey and outcomes, and delivering the final Study Presentation and live demo
